

OSM#11 HACKFEST NETNUMBER CNF

May 31st – June 4th, 2021

OBJECTIVES FOR THE OSM#11 HACKFEST

- Validate the CNFM capabilities of the ETSI OpenSource MANO (OSM NINE)
- Create the onboarding artifacts (NS and VNF packages) for the NetNumber CNF
- Onboard the CNF and execute basic LCM tasks (instantiation, upgrade, termination)
- Set up and verify the VNF Configuration API (ETSI GS NFV-SOL 002)

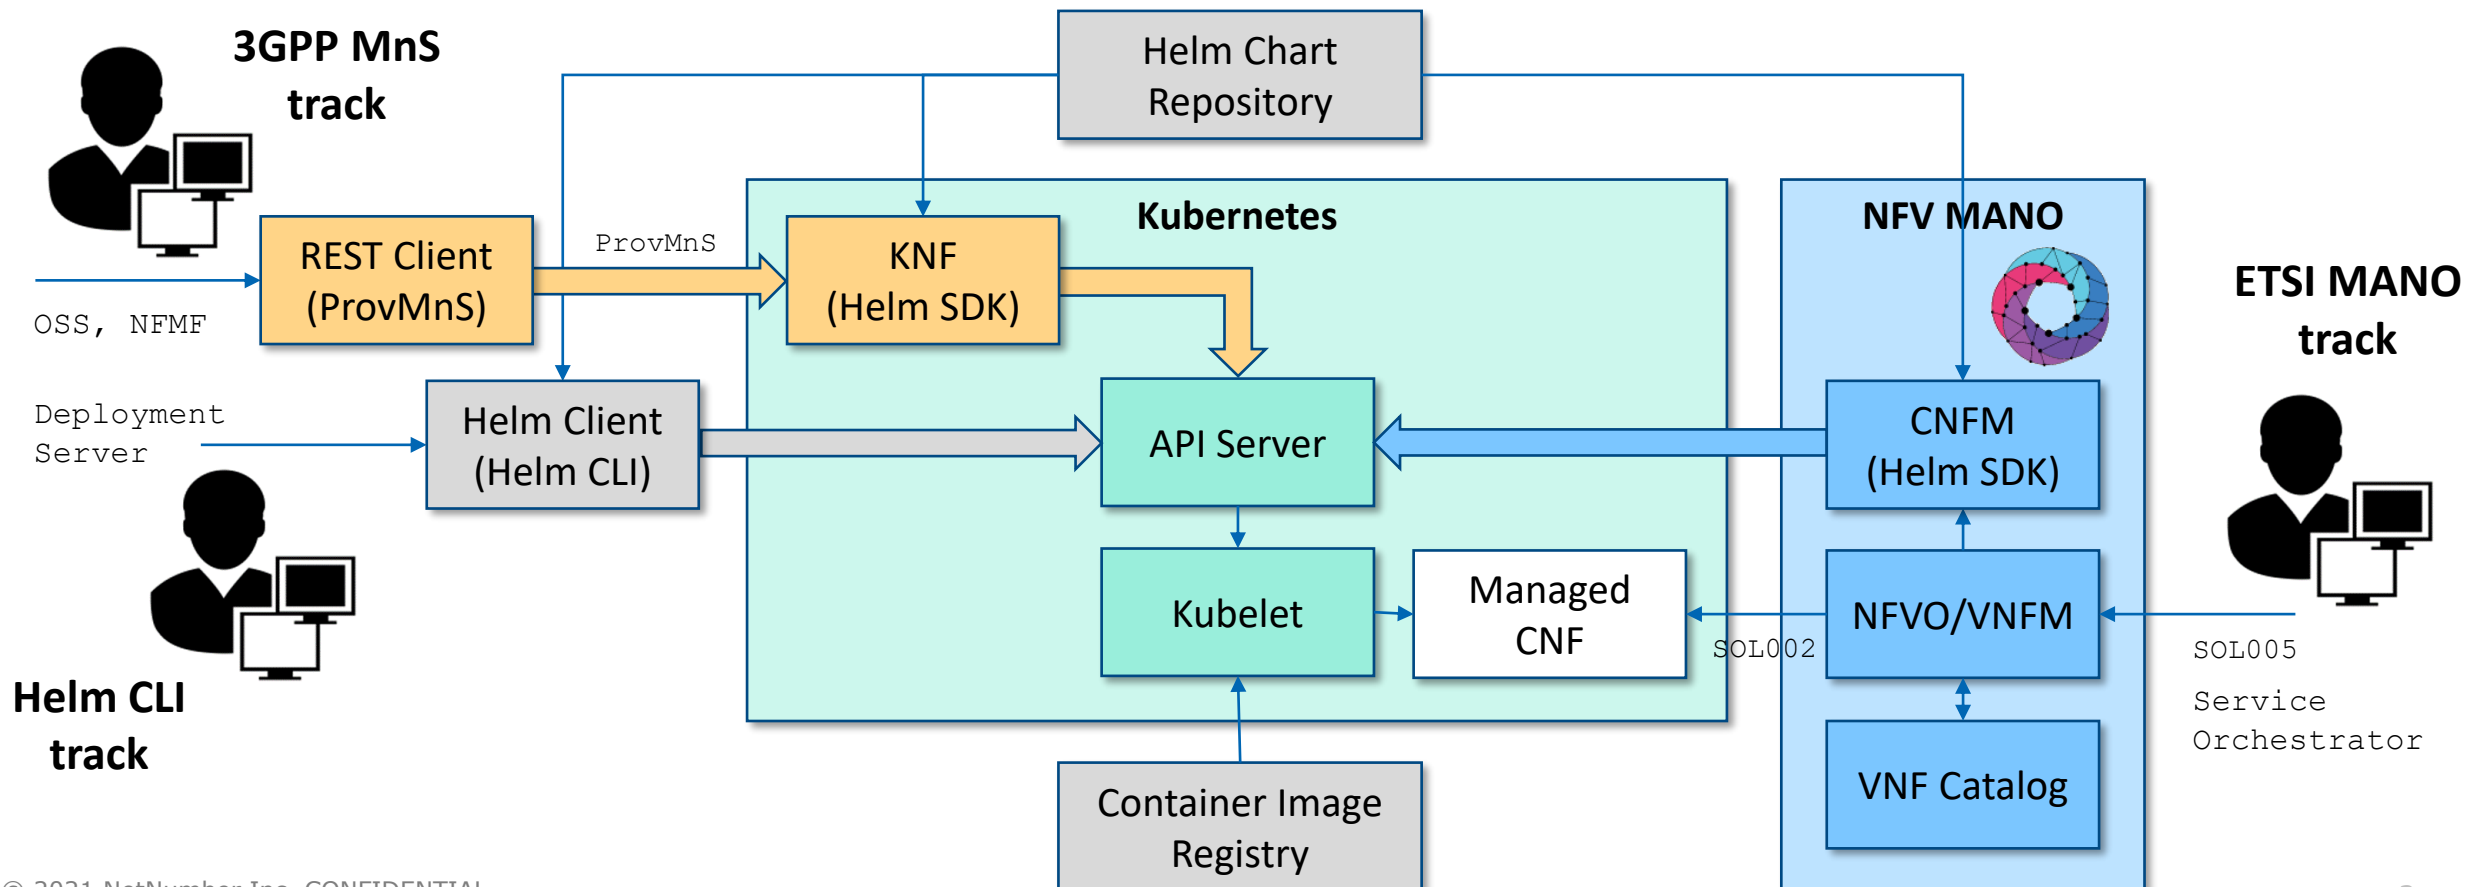

Result:

- All objectives met but the setup of the VNF Configuration API (ETSI GS NFV-SOL 002)
- In addition, the OSM NBI (ETSI GS NFV-SOL 005) was successfully verified (offline system)

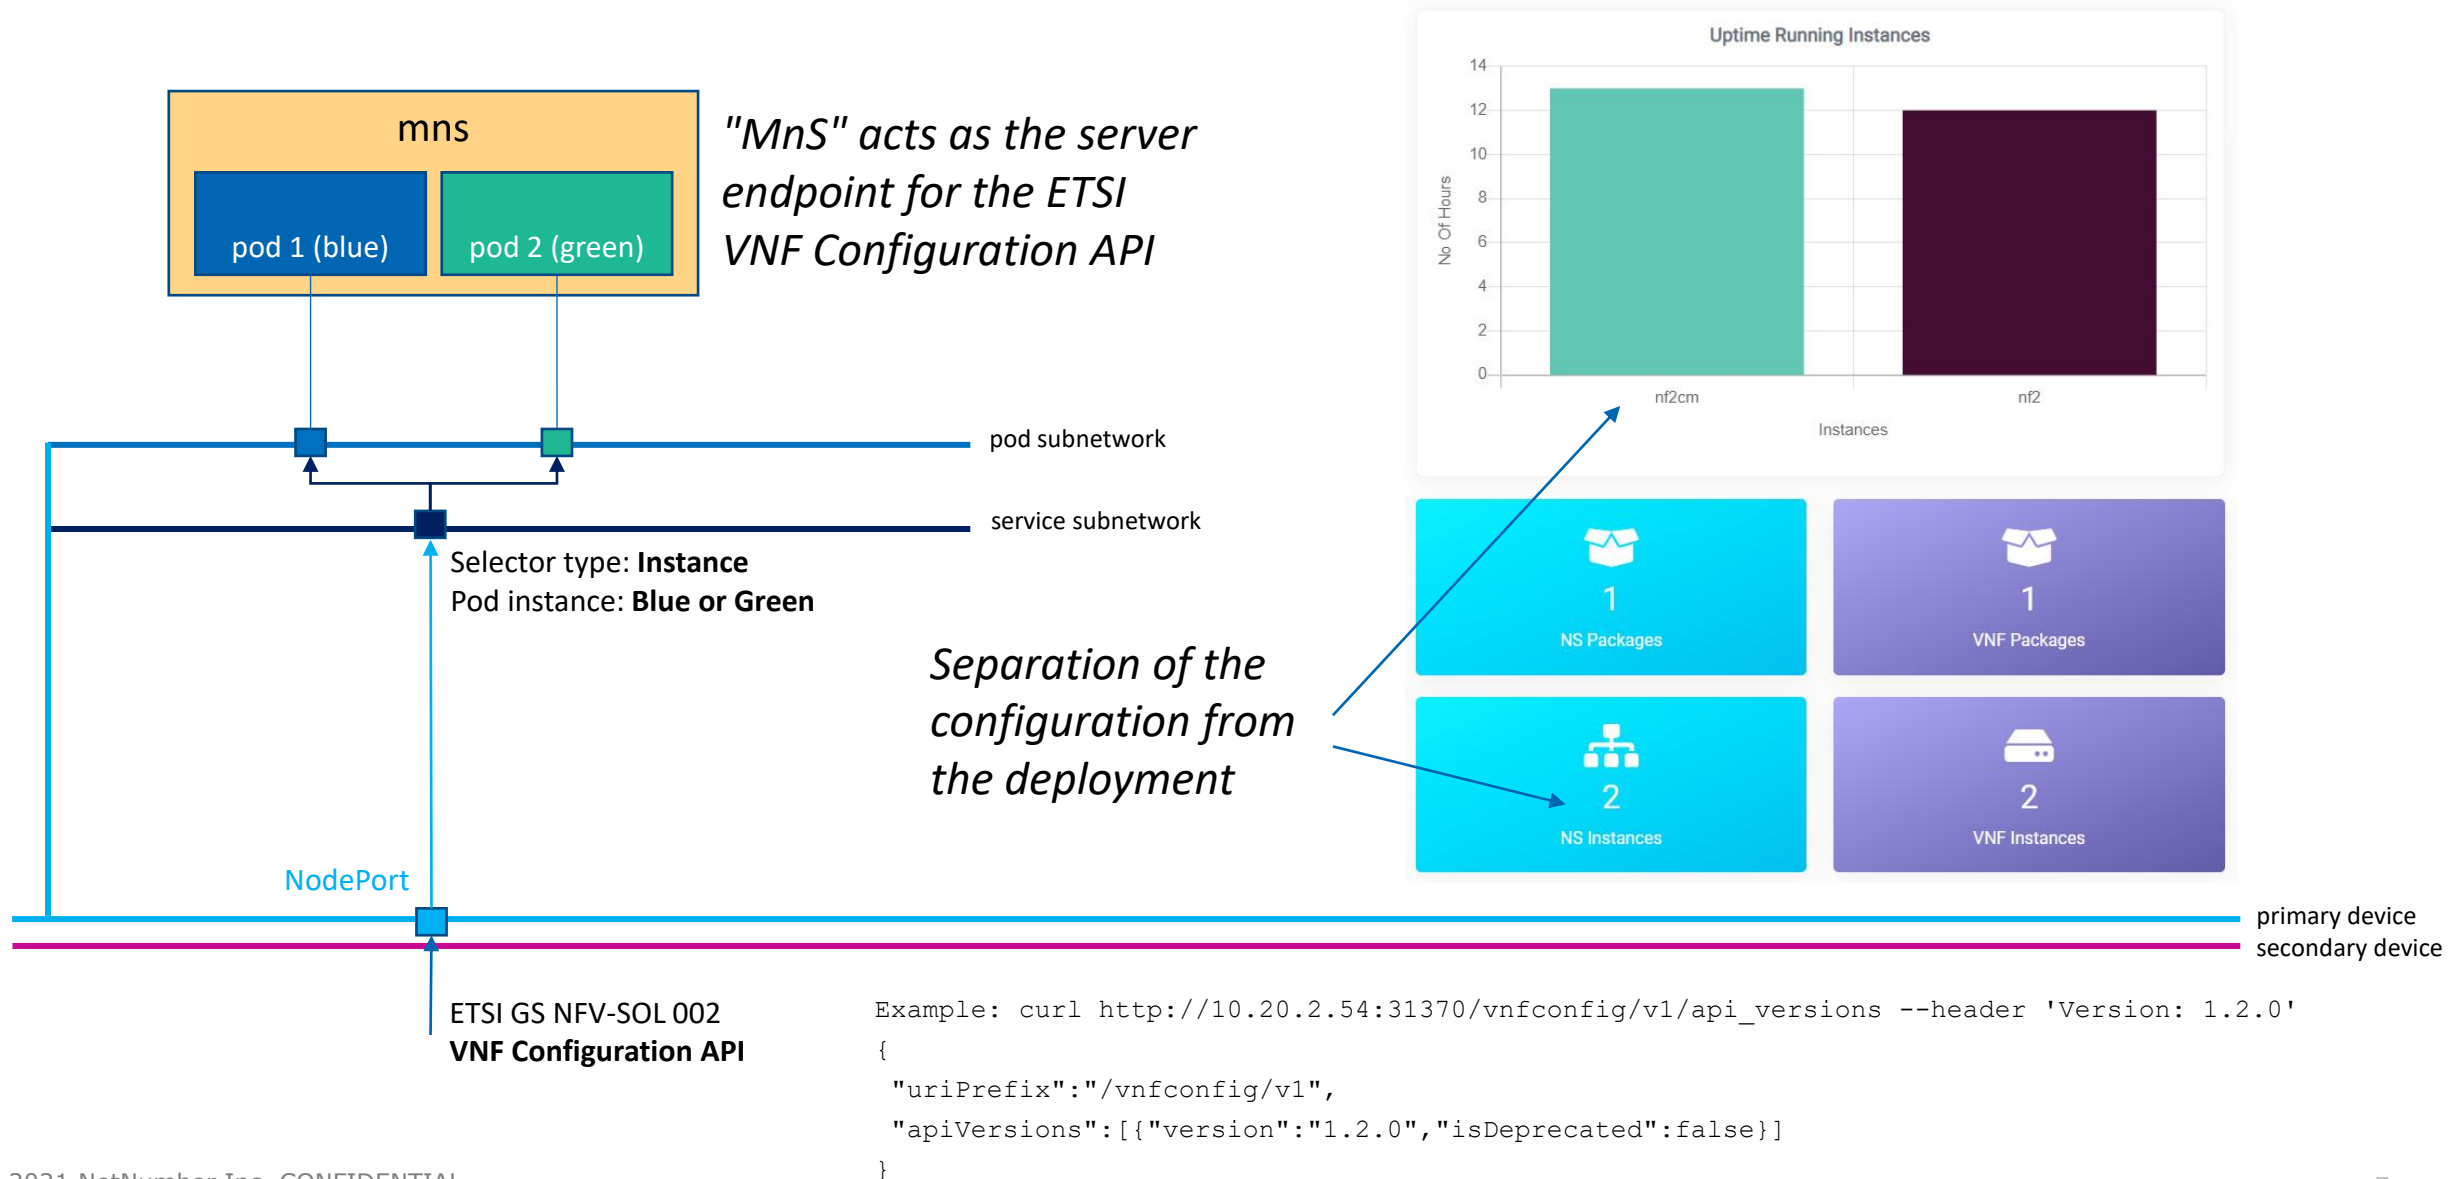

CNF MANAGEMENT OPTIONS

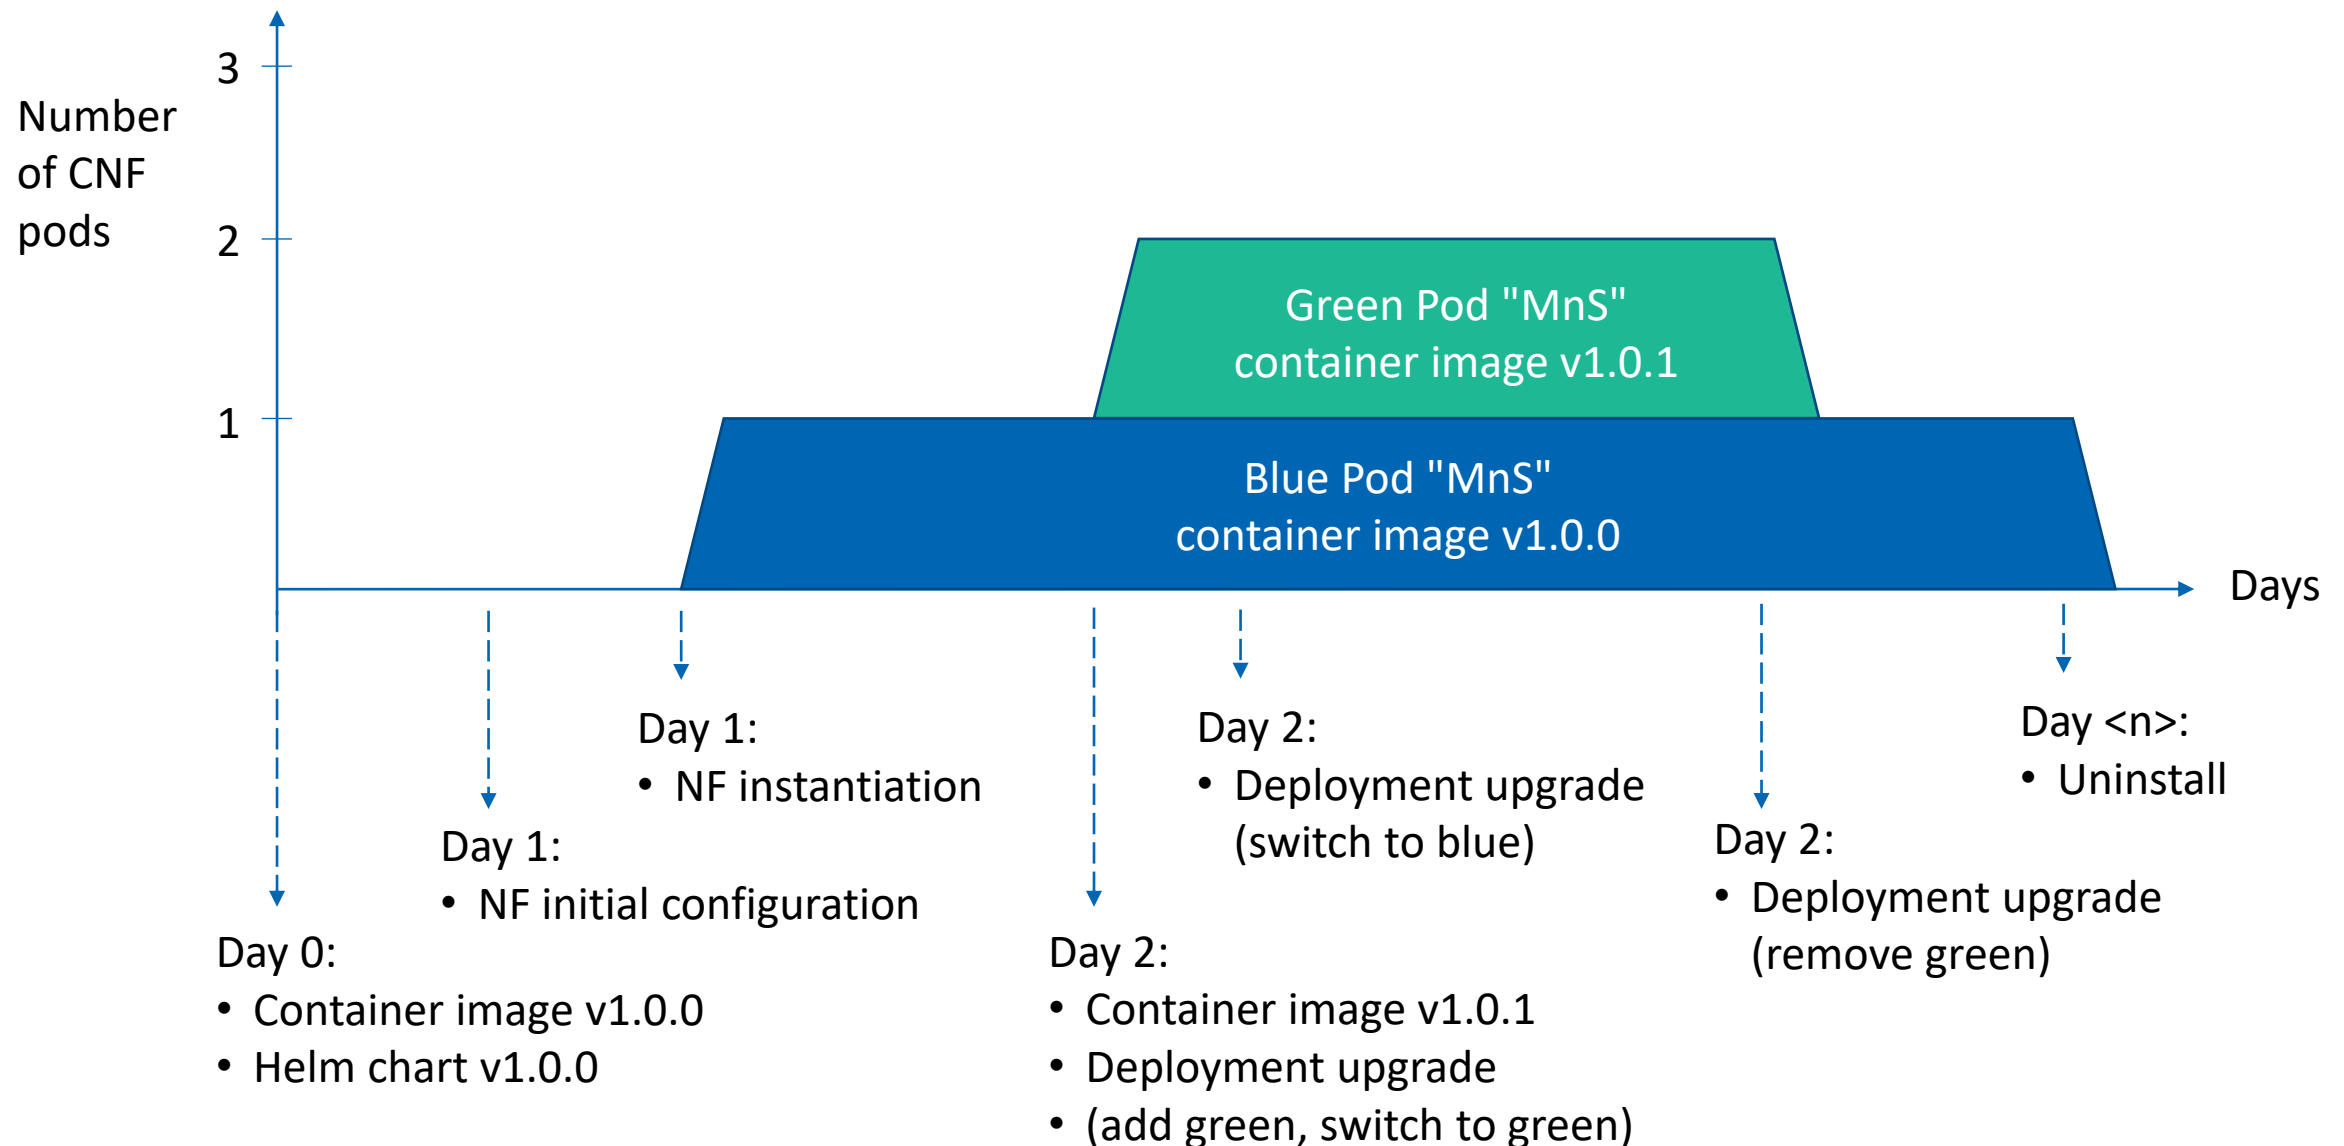

CNFs (containerized workload) is managed by Helm that is the de-facto standard packaging framework for Kubernetes. The lifecycle of a CNF instance (release) is managed by the **Helm Client** that can be operated from the **CLI** or can be part of NFV-MANO (AKA **CNFM**) or can be deployed as a specialized CNF (AKA **KNF**).

Findings

- **Great event! Great support from the instructors! Big THANK YOU!**
- OSM capabilities ok. Useful add-ons (e.g. setting the Helm release name) slotted for OSM TEN.
 - Closer alignment with ETSI GS NFV-SOL 004 and 007 recommended (package structure and security)
 - *ETSI GS NFV-SOL 002 VNF Configuration and Indicator APIs still to be researched by NetNumber*
- Helm-chart based LCM needs additional work. Examples:
 - Custom execution environments to be exposed, configured and invoked from the GUI
 - Helm values templating to be supported in conjunction with the configurable attributes
- Rainy day scenarios may need further work.
 - Errors in the artifacts or params make the NS instance fail, but the termination also fails when the KDU was not created ("Terminating KDU 'nti-nf': kdu_instance chartmuseum-osm-nf-0043872352 not found"). "Force delete" of the NS instance is (often) needed till the setup is right.
 - "Something went wrong. Please try again." message not really helpful (expired session, connectivity issue, timeout?)
