

# Open Source MANO

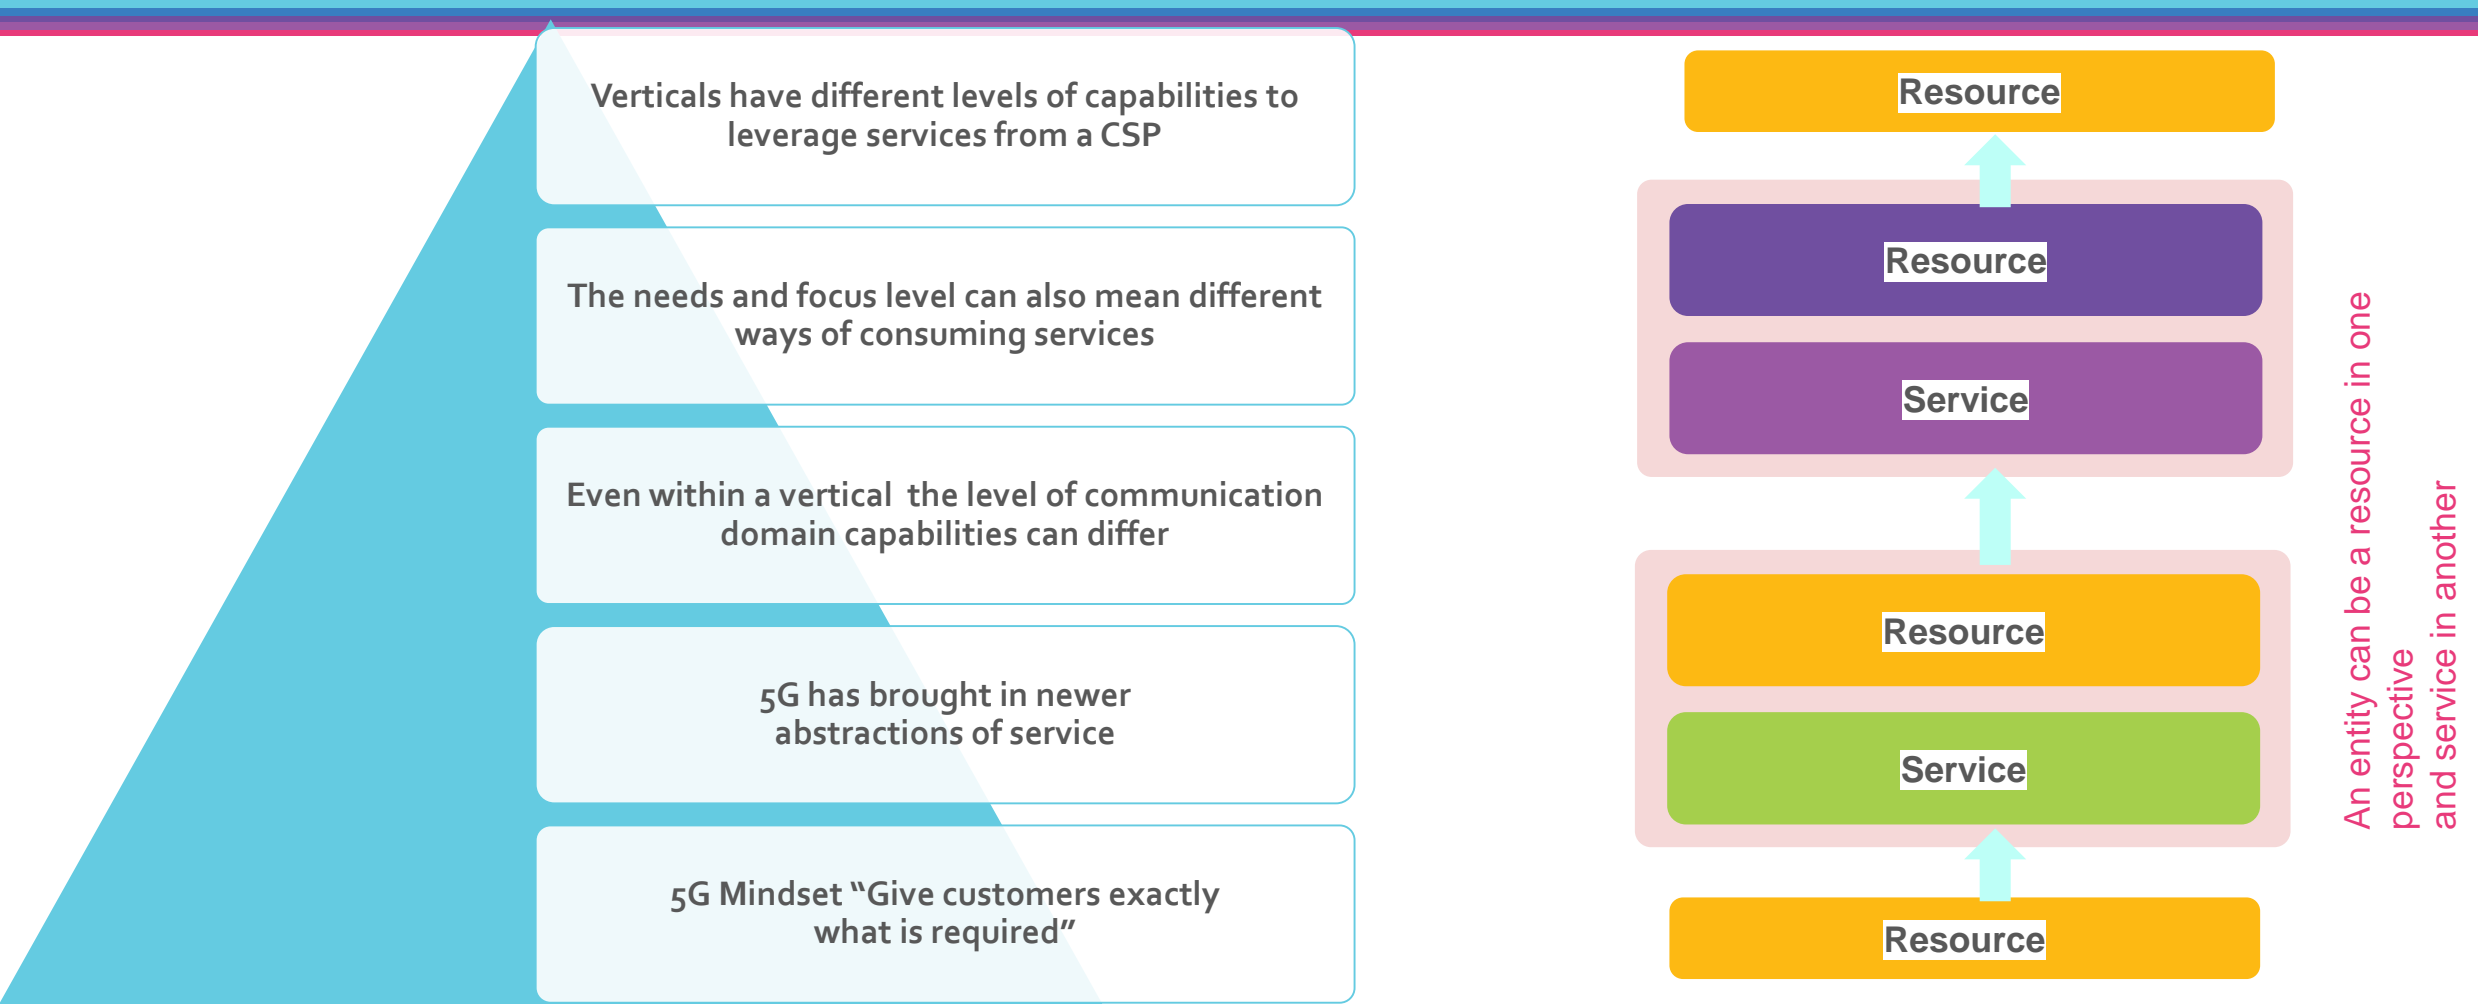

## Extending TMF APIs into OSM MANO

Principal Architect – Joe Issac

( [joe.issac@wipro.com](mailto:joe.issac@wipro.com) ), CTO Office, Wipro Technologies

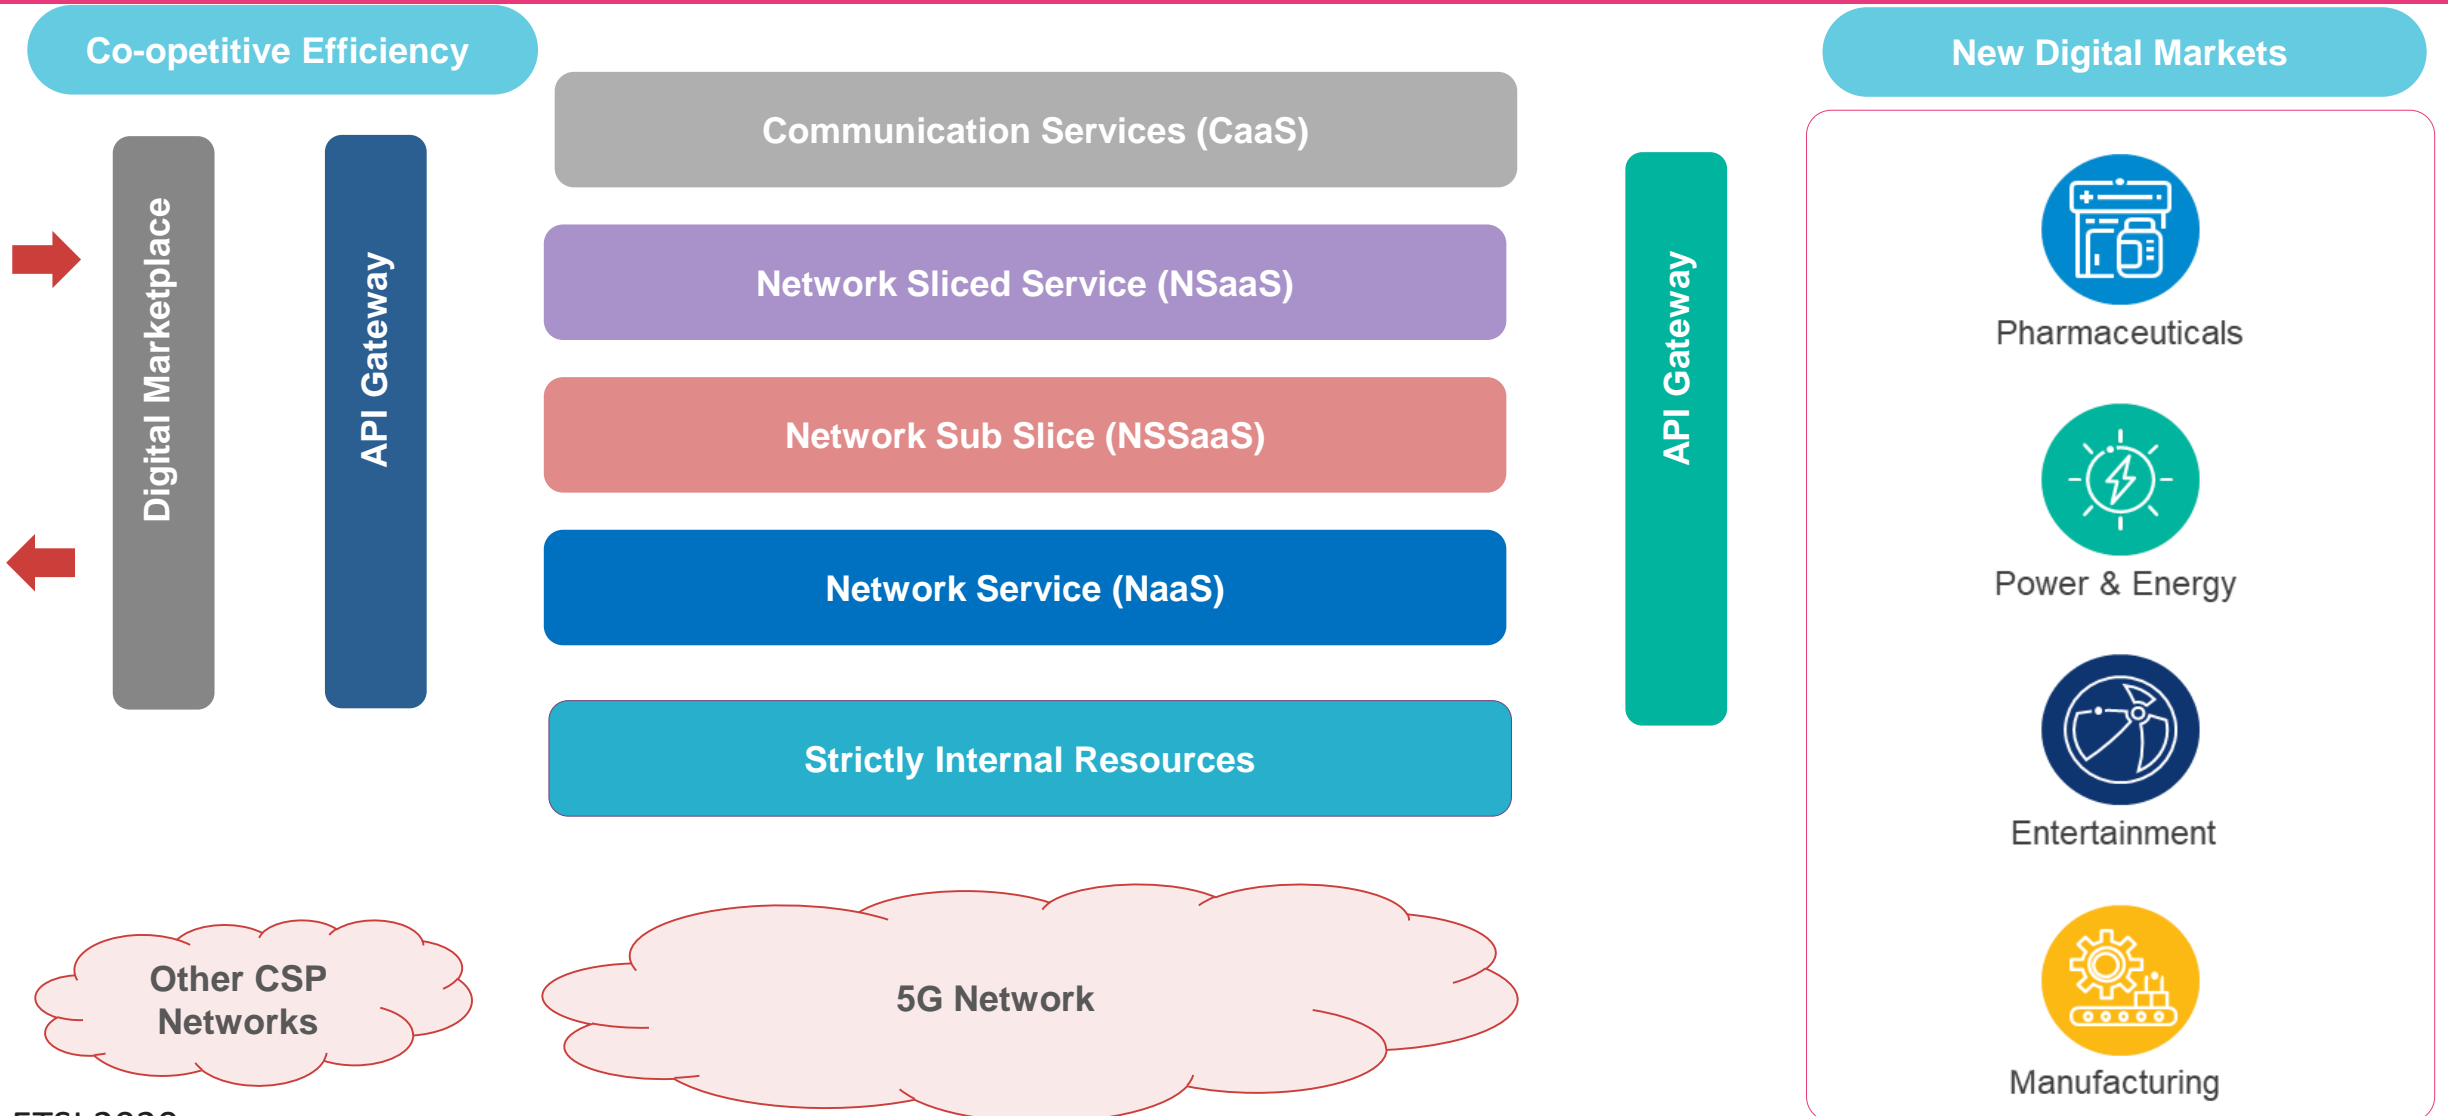

# Providing Communication Services to manage Complex Vertical Markets

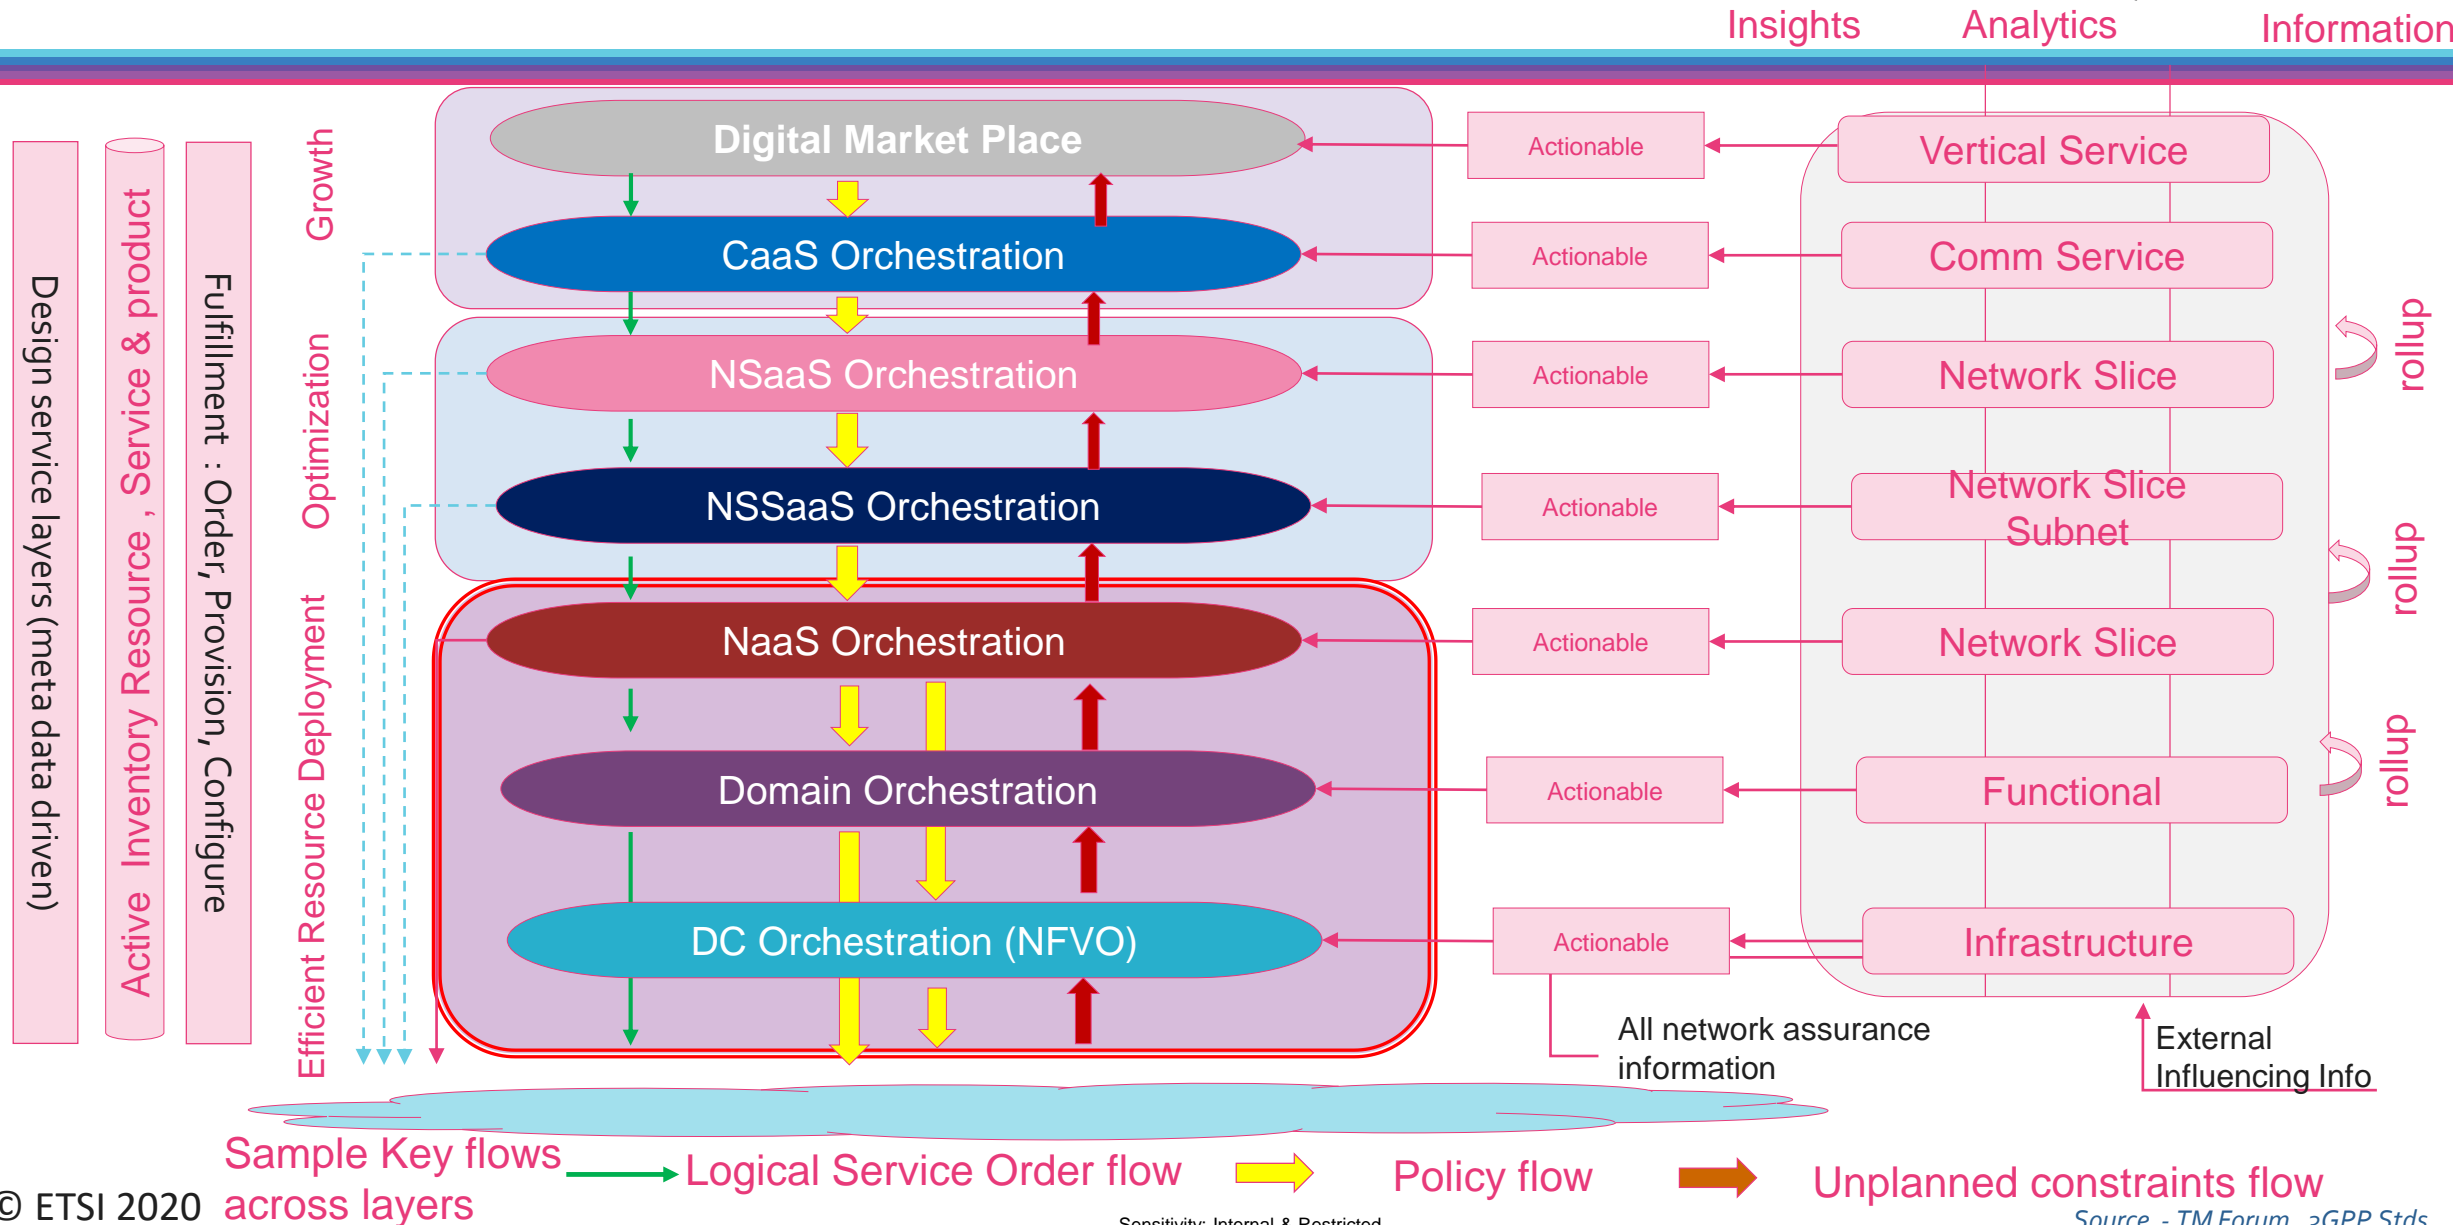

In communication Industry "SERVICE" is heavily overloaded word and can mean many different things in different contexts

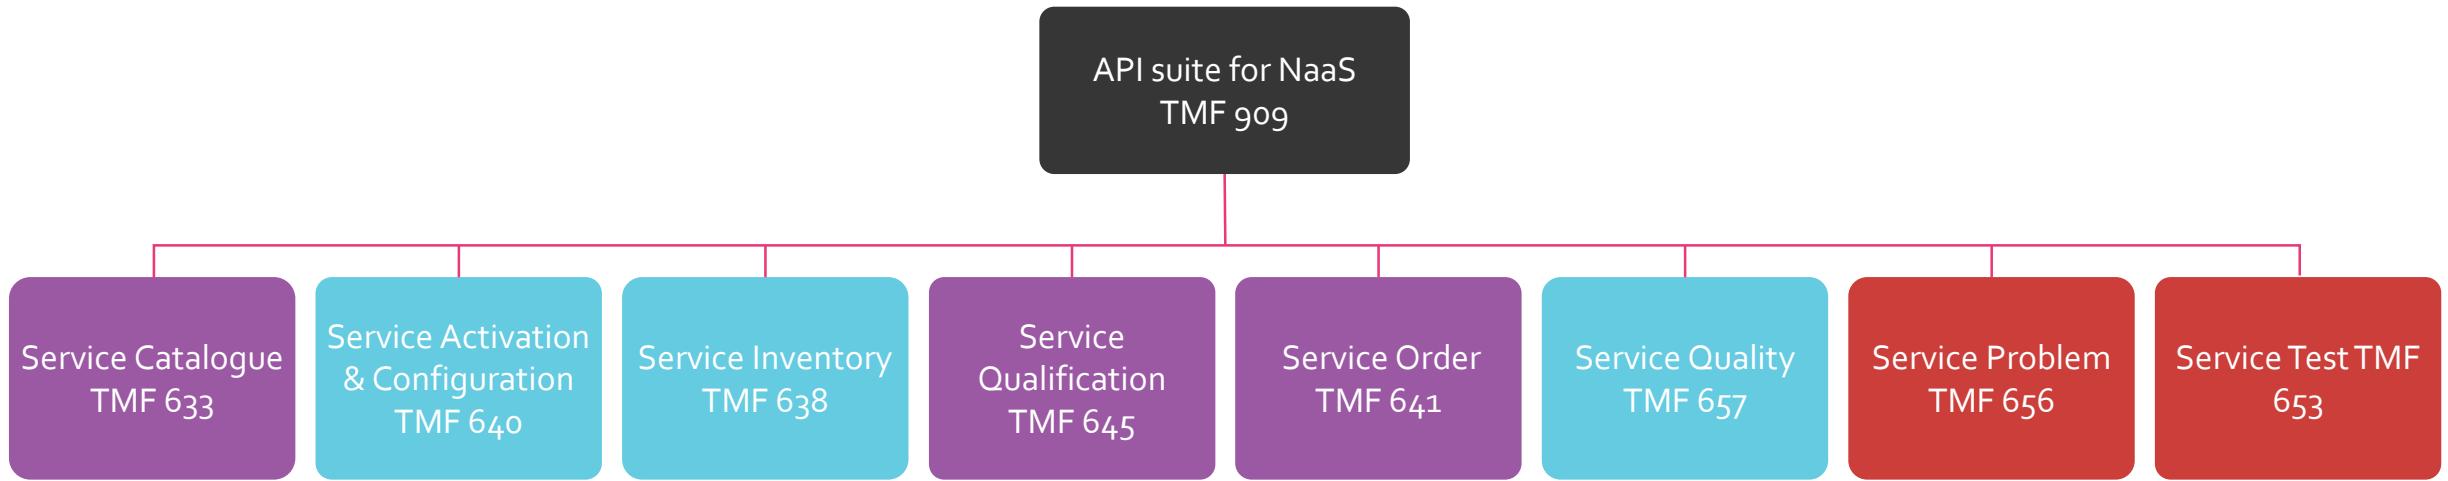

# Different types of Service Abstraction to address Vertical Markets

# Multi-layered Closed loop Orchestration Architecture

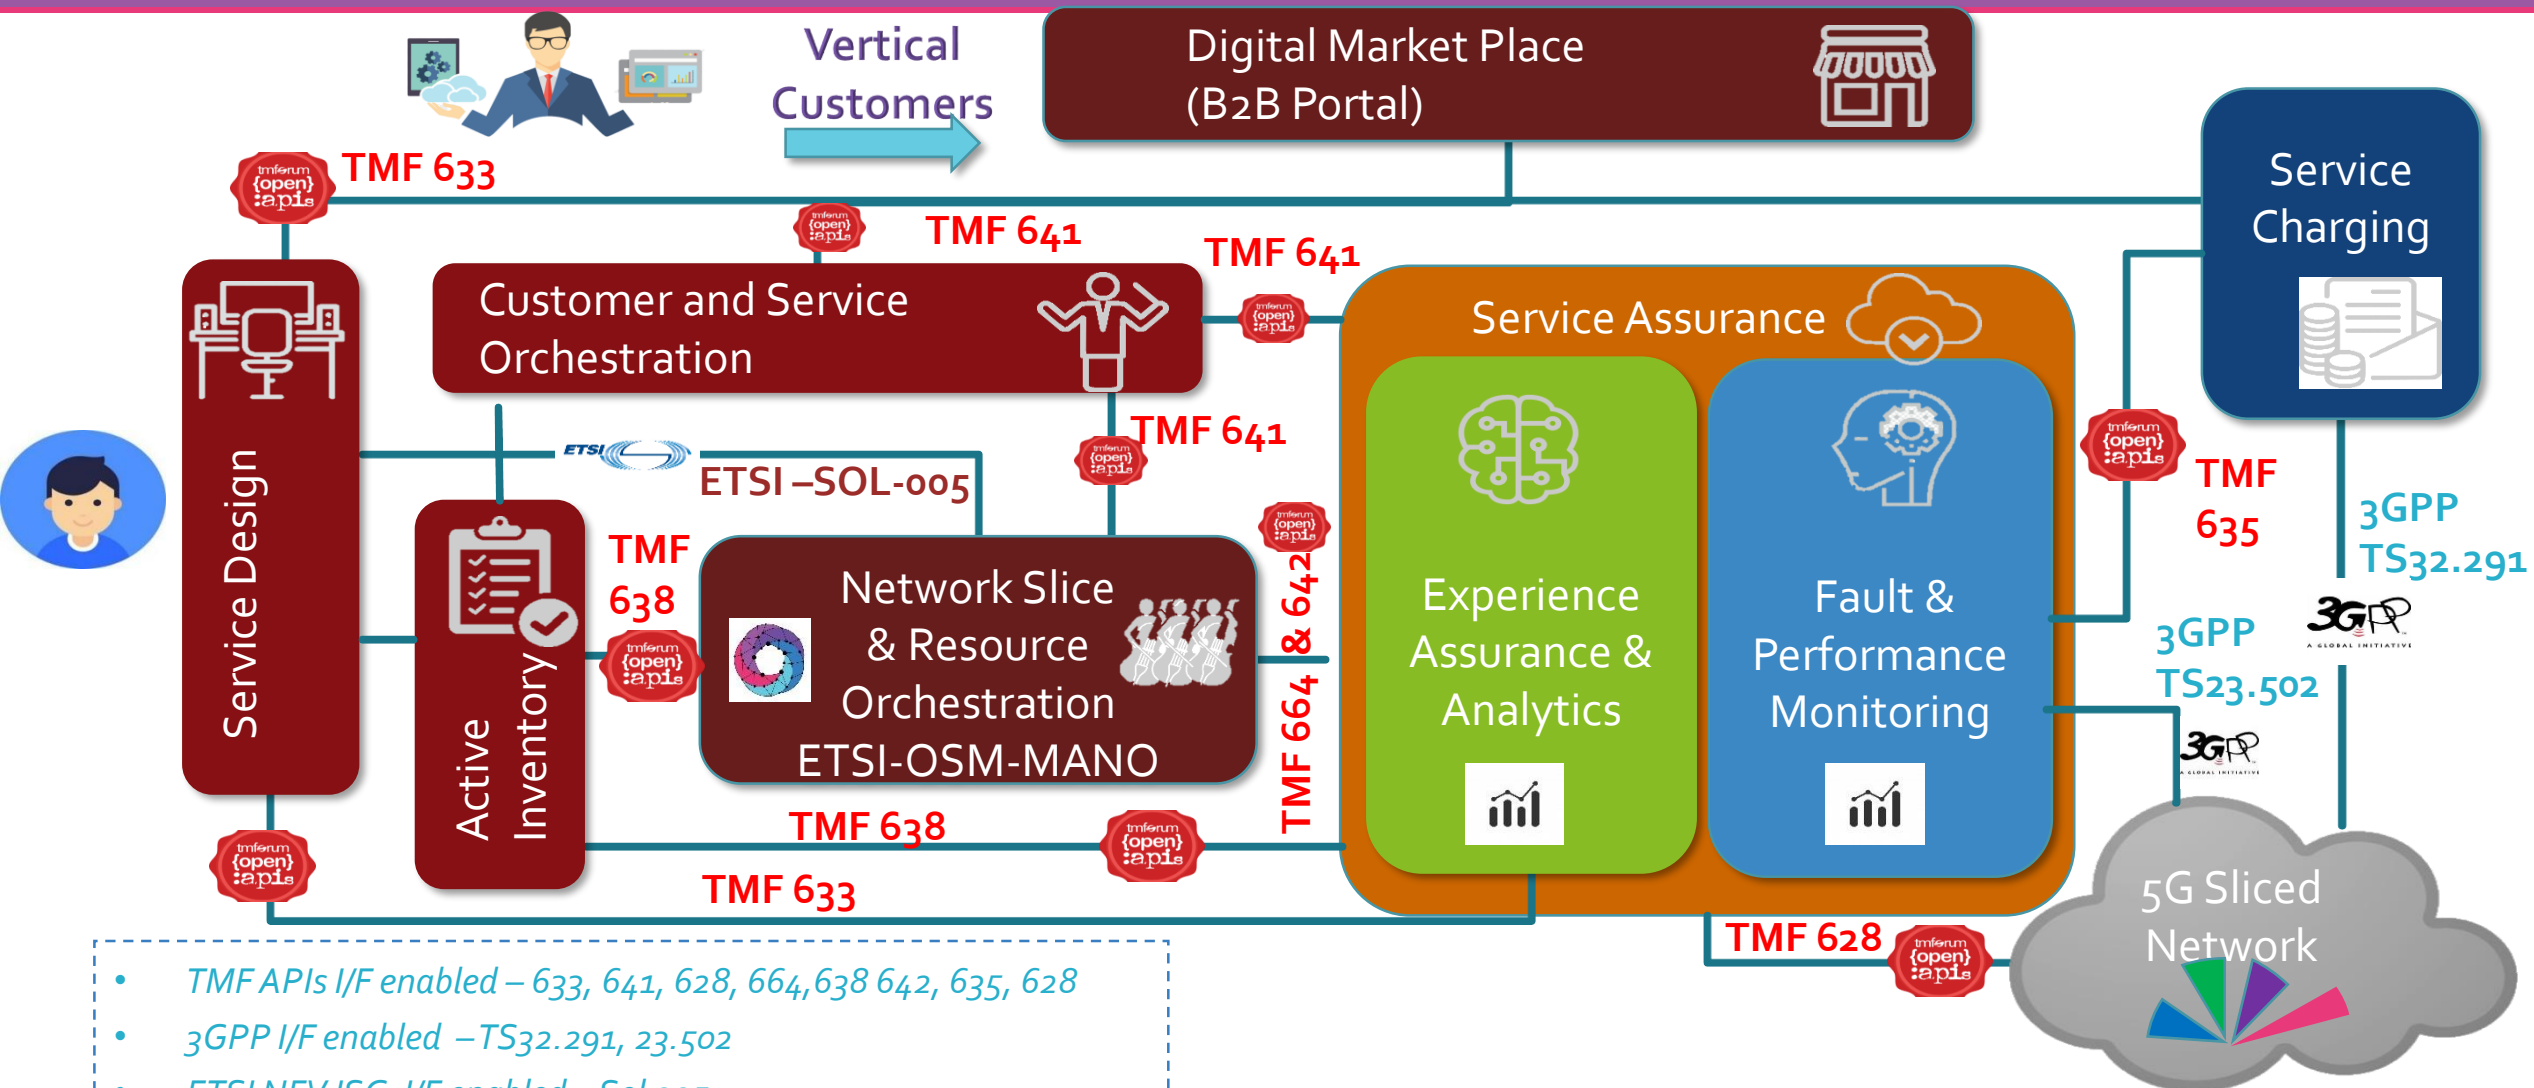

# Exposing Service Abstraction through TMF APIs (NaaS API)

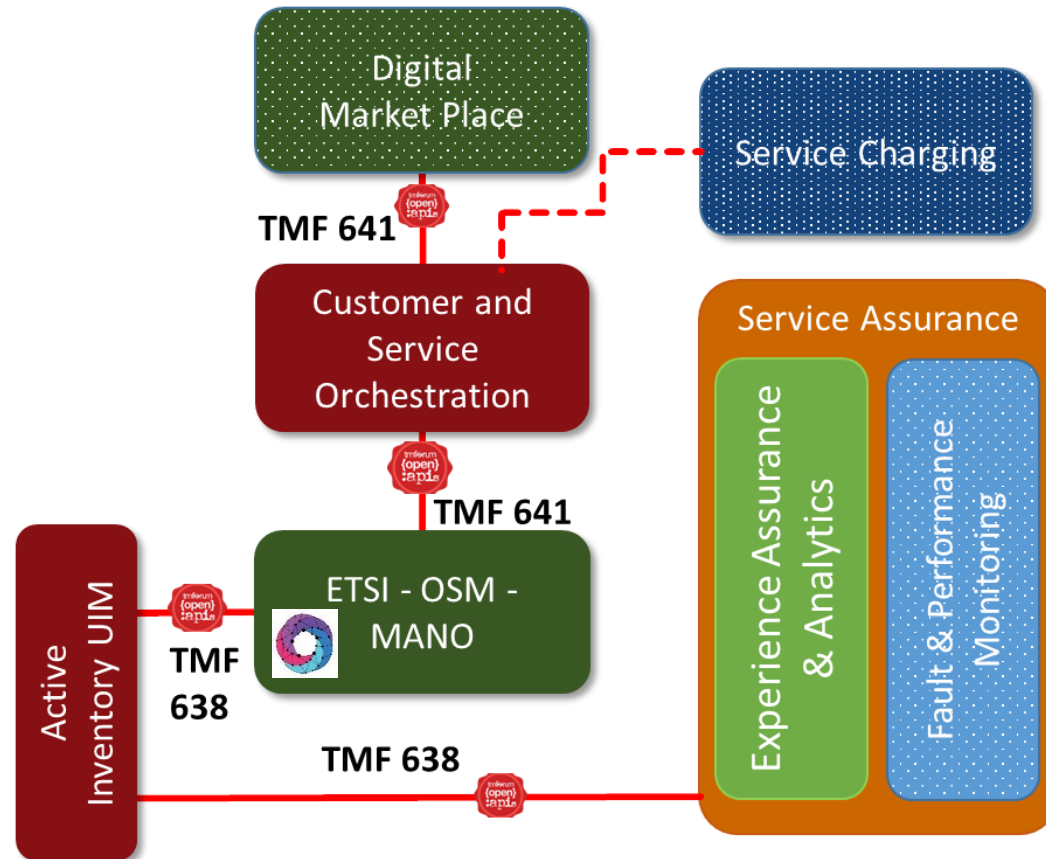

- TMF APIs are defined at fairly abstract level and can be leveraged for different types of service abstraction
- TMF 909 gives a comprehensive view of how these different APIs come together to create different business process
- While TMF 909 focuses on NaaS, it can be applied to different service abstraction NSaaS, NSSaaS, CaaS
- Suggested order of reading Green, Blue, Grey and Purple Quick read Green and Purple
- Specifications TMF 6XX <https://projects.tmforum.org/wiki/display/API/Open+API+Table++Production>
- API suite for NaaS TMF 909 <https://www.tmforum.org/resources/specification/tmf909-api-suite-specification-for-naas-v3-0/>

# #1Ref Architecture - Enabling TMF API's into ETSI OSM MANO with Service Design & Modelling

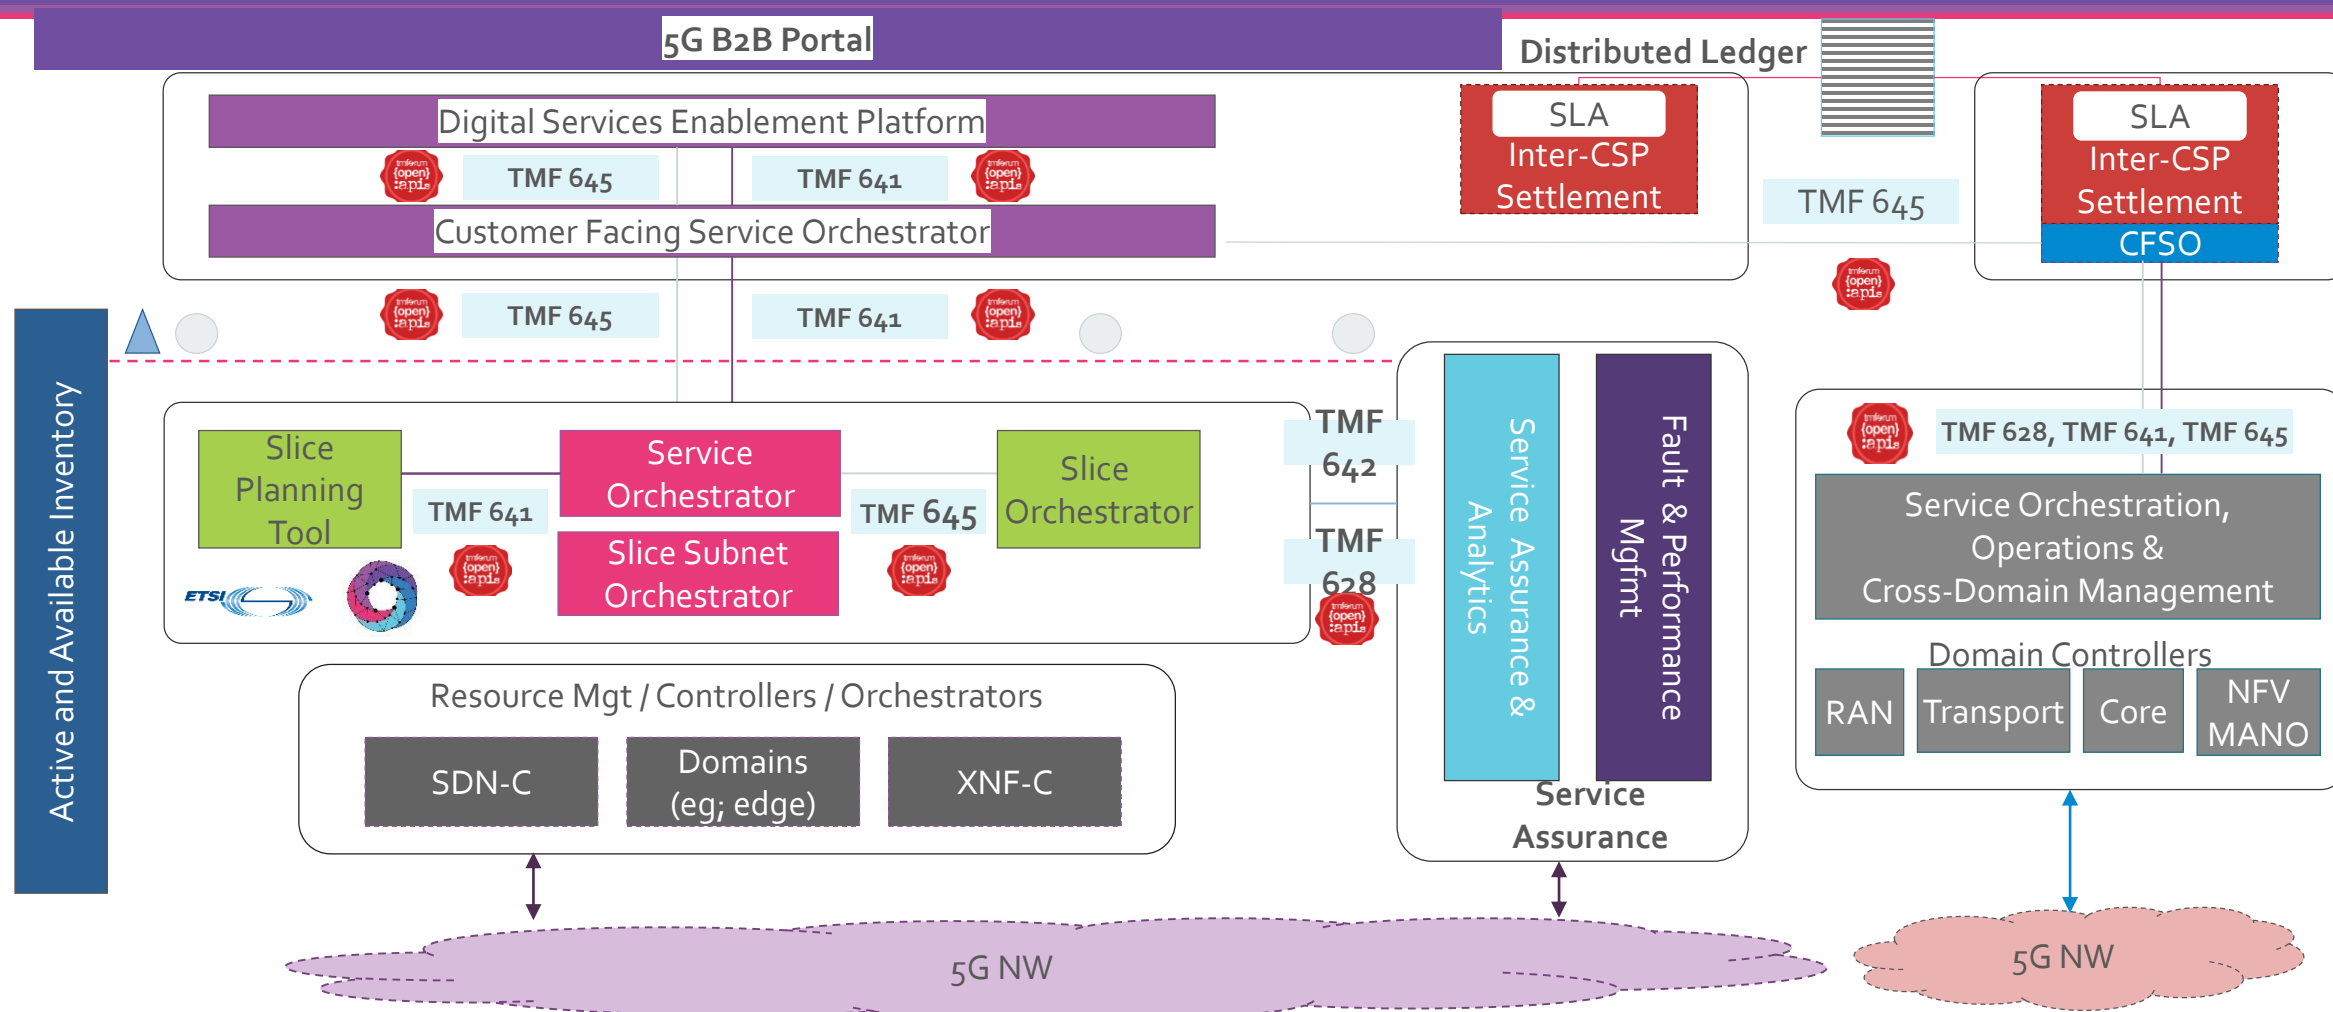

# Orchestrating and Dynamic allocation of 5G Network Slices

- Comprehensive end to end orchestration and managing life cycle of 5G services
- 1 • Orchestrating communication services
  - 2 • LCM of CFS and Network Slices
  - 3 • Maintaining consistencies across different management layers

# Extending OSM MANO - Network Layers of Abstraction & Orchestration using TMF API

## Customer Service

- E2E Customer service In which one or more communication service are key components

## E2E Communication Service Inter-CSP

- Specific information exchange service between multiple end points
- May span CSP boundaries

## Communication Service Intra-CSP

- Service spanning across network domain between SAPs

## Network Slice as a Service (Sequence of NSIs)

- Leverage of one or more NSIs in sequence to support mobility

## Network Slice Instance

- Independently manageable logical network, service guaranty between SAPs

## Network Subnet Slice Instance

- Subnet level entity to rapidly compose NSI & simplify management

## E2E Network service (ETSI –NFV), SDN-R, SDN-C

- Resource layer Orchestrators, Controllers and Managers

DSEP (Digital Services Enablement Platform)

CFSO (Customer Facing Service Orchestrator)

### Extending OSM-Service Orchestrator roles

SO (Service Orchestrator – for CS)

SLO ((Mobility) Slice Orchestrator – eCSMF\*)

SO (Service Orchestrator – NSMF\*)

SS-LO (Subnet Slice LC Orchestrator) – NSSMF\*

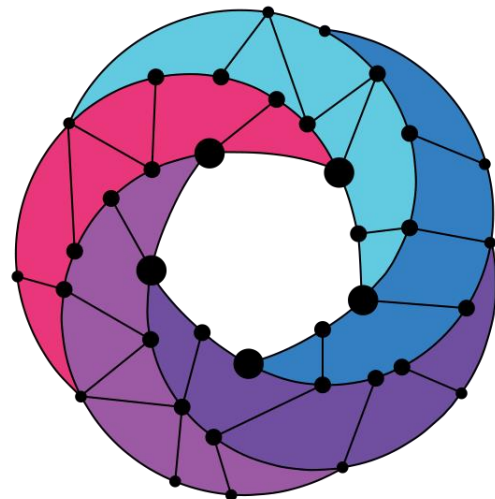

Resource Layer Orchestrators (NFV/SDN)

\* 3GPP CSMF – Communication Service Management Function, NSMF – Network Slice Management Function, NSSMF – Network Slice Subnet Management Function

## **TMF extensions to OSM MANO have the following aspects:**

- Able to expose communication services aligned with specific vertical industry use cases
- Orchestration of specialized and guaranteed services in a timely manner & on-demand.
- Fulfillment of SLAs guaranteed through on-the-fly process monitoring at control layer and charging mechanisms
- Enforcing SLA guarantees based on Network & Service related KPIs & KQI that are collected at Network Slice Instance level
- Predicting change in demand for business critical services, and triggering dynamic & closed loop mitigating actions
