OSM Hackfest – Session 4
Adding day-0 configuration to VNFs
Gianpietro Lavado (Whitestack)

What is cloud-init and what can it be used for?

- It is a Linux package used to automate initial configuration of a VM
- VM requirements:
 - Cloud-init package
 - Cloud-init configuration (data source) via /etc/cloud/cloud.cfg
 - Config drive
 - Openstack metadata server
 - ...
- What can be done?
 - Setting a default locale
 - Setting an instance hostname
 - Generating instance SSH private keys
 - Adding SSH keys to a user's .ssh/authorized_keys so they can log in
 - Setting up ephemeral mount points
 - Configuring network devices
 - Adding users and groups
 - Adding files
- Docs: <http://cloudinit.readthedocs.io/en/latest/>

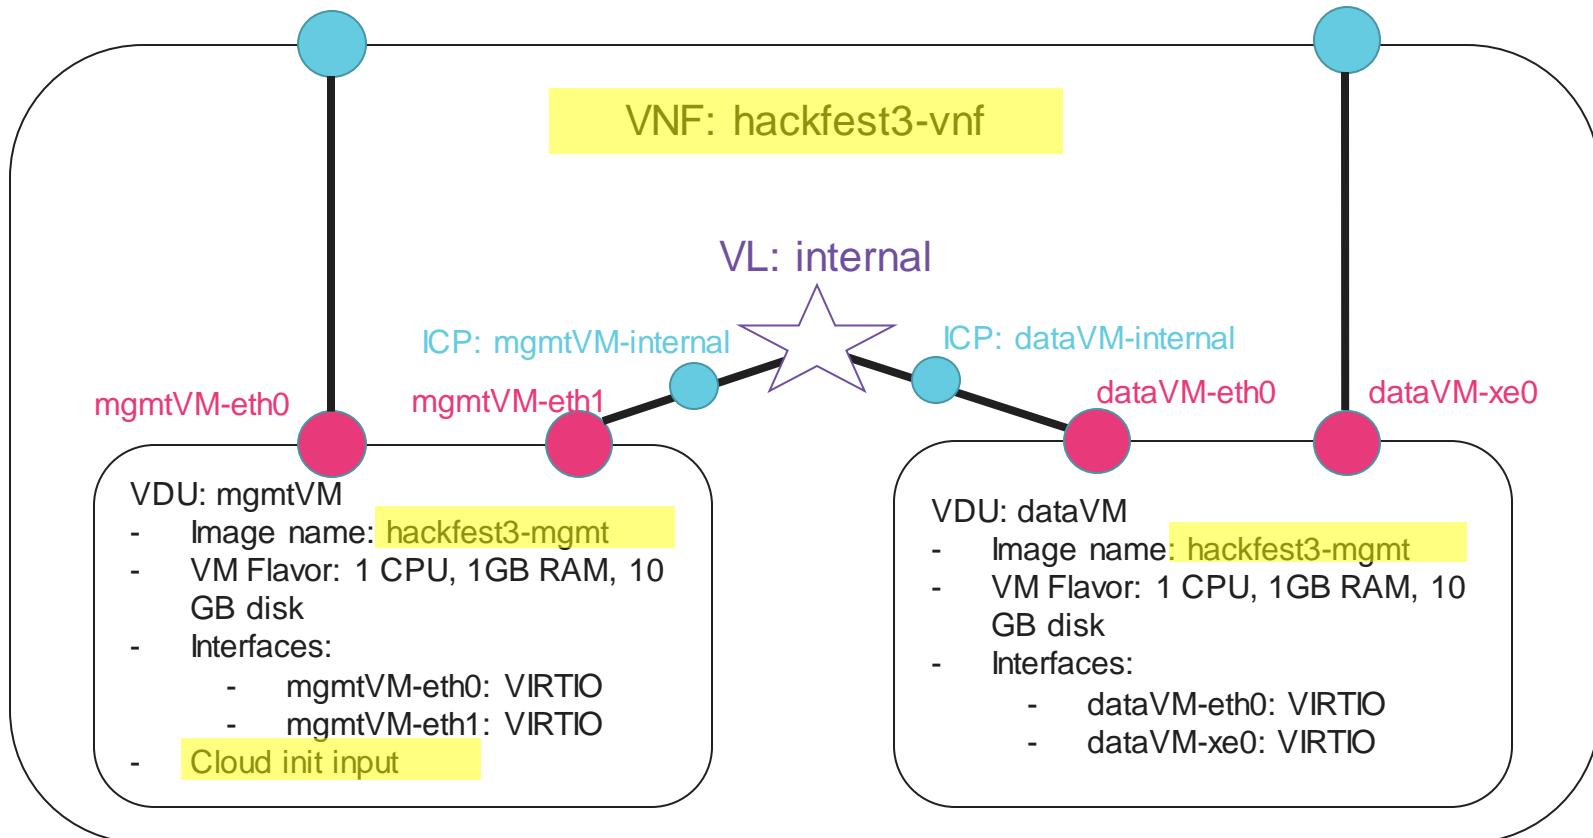

- Cloud-init is only available in Linux VMs
- Not all VIMs support cloud-init via a metadata server
- While cloud-init is supported in OSM, the recommendation is to use charms and initial-config-primitive

VNF diagram

Changes highlighted in yellow

External Connection point: vnf-mgmt External Connection point: vnf-data

Creating the VNF (1/2)

- Go to the command line
- Copy VNF hackfest2 folder and rename it to hackfest3
- Modify the new VNF
 - Name: hackfest3-vnf
- Modify VDU mgmtVM:
 - Image name: hackfest3-mgmt
 - Cloud init input:
 - Filename
 - Cloud init file: cloud-config.txt

Creating the VNF (2/2)

- Modify VDU dataVM:
 - Image name: hackfest3-mgmt
- Add a new asset:
 - CLOUD_INIT:
 - Upload file: cloud-config.txt
 - It can be downloaded from: <https://osm-download.etsi.org/ftp/osm-4.0-four/3rd-hackfest/other/cloud-config.txt>
- Onboard your new VNFD to the system.

Let's explore the Cloud-init file

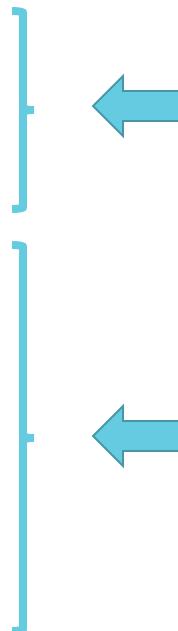

- Download it from here:
 - <https://osm-download.etsi.org/ftp/osm-4.0-four/3rd-hackfest/other/cloud-config.txt>

• Content:

```
#cloud-config
password: osm4u
chpasswd: { expire: False }
ssh_pwauth: True

write_files:
- content: |
    # My new helloworld file

    owner: root:root
    permissions: '0644'
    path: /root/helloworld.txt
```

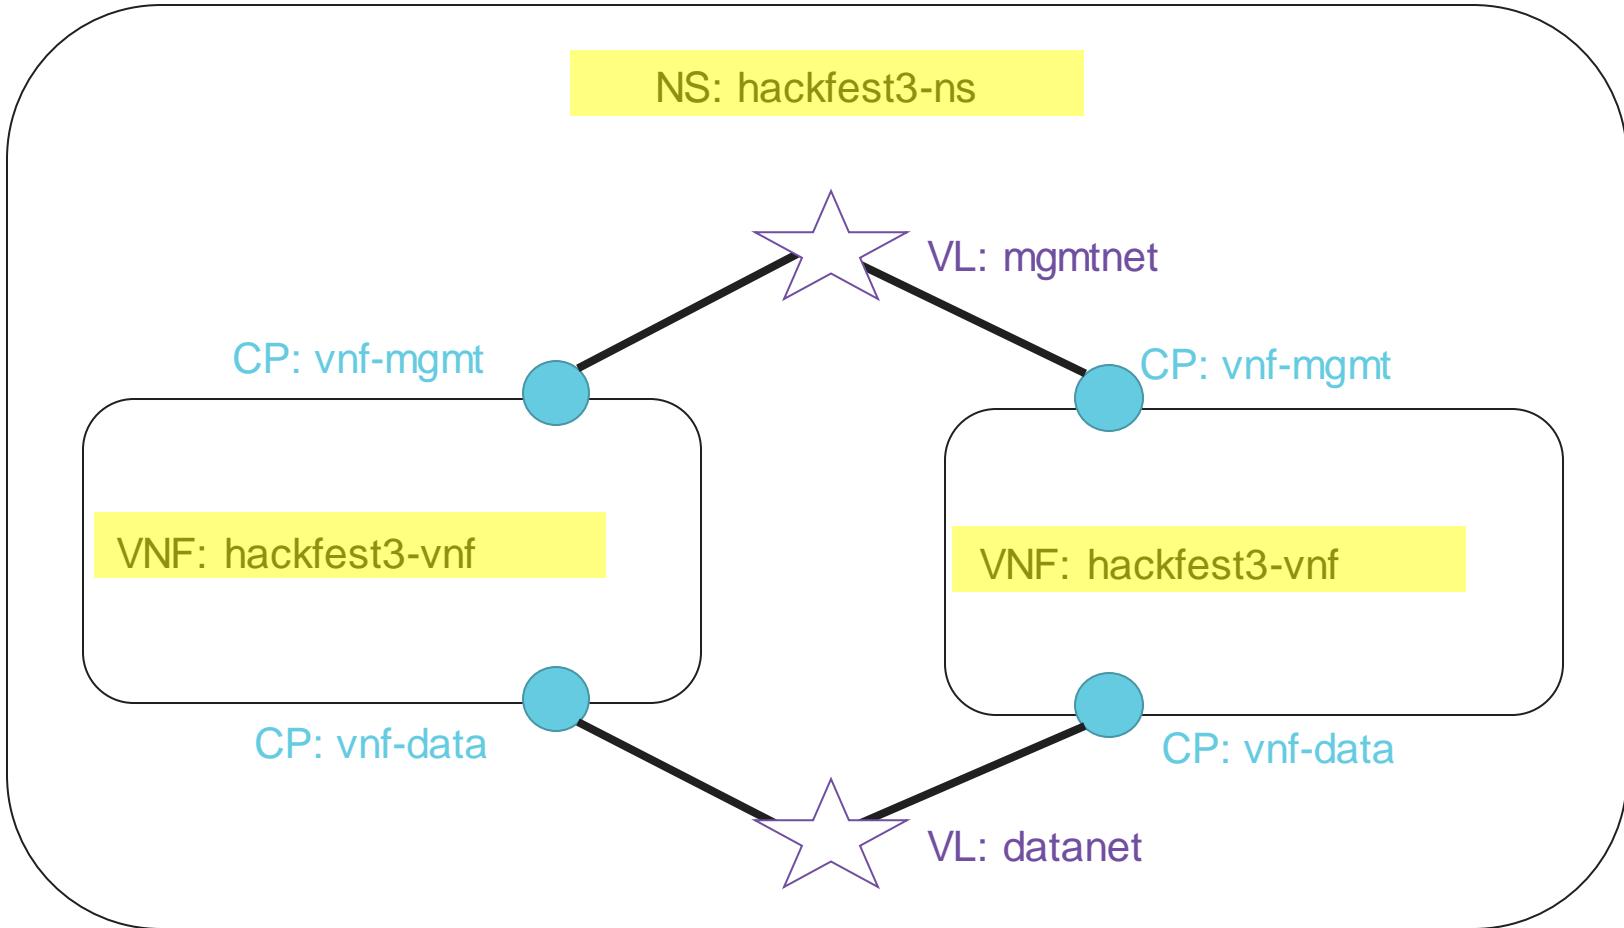

A password is added for the default user ('ubuntu'). This will be used by the charm in Hackfest session 7.

A new file '/root/helloworld.txt' will be created at VM creation to illustrate the way this feature works.

NS diagram

Changes highlighted in yellow

Creating the NS (1/2)

- Add NSD
 - Name: hackfest3-ns
- Add 2 VNFs (hackfest3-vnf)
- Add a first VLD:
 - VLD1:
 - name (optional): mgmtnet
 - TYPE: ELAN
 - MGMT NETWORK: True
 - INIT PARAMS
 - vim-network-ref
 - VIM NETWORK NAME: mgmt

<- In order to have a default mapped VIM network name

Creating the NS (2/2)

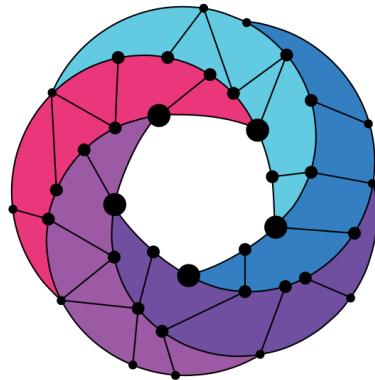

- Add a second VLD:
 - VLD2:
 - name (optional): datanet
 - TYPE:ELAN
 - MGMT NETWORK: False (default)
- Connect VNF Connection Points to the VLs:
 - vnf-mgmt to VLD:mgmtnet
 - vnf-data to VLD:datanet
- Onboard your NSD

Deploying NS in the UI

- Select hackfest3-ns and instantiate it
- Complete the form
 - Add a name to the NS
 - Select the Datacenter where the NS will be deployed
 - Add SSH key
- Go to the dashboard to see the instance and get the mgmt IP address of the VNF
- Connect to each VNF:
 - ssh ubuntu@<IP>
- Check that the cloud-config file was executed
